

NEXT GENERATION POWER AMPLIFIERS

CW & PULSE

Highest power density
with patented new hardware
and software architecture
that is unrivaled

A unique design architecture from Empower RF Systems is yielding unprecedented size and weight reduction for 500W, 1 kW, and multi-kW power amplifier platforms. These breakthrough designs have been fielded using both LDMOS and GaN devices for user applications that include EMC / Radiated Immunity, Communications, EW, Radar, and RF Component Testing.

SIMPLIFY YOUR SYSTEM INTEGRATION

- Accurate input and output power metering based on user-selectable modulation mode
- With no software to install, monitor and control from your PC directly with peer-to-peer connection or on your local network
- Wifi control and monitoring by PC/Tablet/Smartphone when wireless router is connected to the amplifier – no local network required
- Full access to internal metering helps identify system problems upstream, downstream, or internal to the amplifier
- Storage of user defined configurations for quick setup of your most common test scenarios
- Small size allows amplifier to be moved around as needed in your test environment

OUTPUT POWER CONTROL [Selectable]

- Automatic Gain Control (AGC) - Utilizes internal feedback for flat gain output across the band
- Automatic Level Control (ALC) - when input signal varies, maintains user defined output without clipping
- Manual Gain Control (MGC) - user controls gain manually, runs like your typical amplifier in open loop

MEASUREMENT MODES [Selectable]

The amplifier reads the proper power level for your modulation type

- CW, CE (constant envelope modulation), FM, AM
- Digital Modulation- user inputs PAR (peak to average ratio)
- Multi-carrier / Multi-tone – up to 16 tones
- Pulse Modulation

PROTECTION

- Load VSWR 3:1 (6:1 at 1/2 Psat)
- Input Overdrive Protection
- Thermal Overload Protection
- Over/Under AC voltage protection
- Out of Band Drive Protection

BUILT IN PEAK DETECTORS

- Input and Output Detectors
- Selectable Peak and RMS

Automatic Gain Control (AGC)

Automatic Level Control (ALC)

AGC mode enables internal feedback to automatically fix the gain to the level you set so the amplifier gain remains flat across the broadband range of the amplifier. This mode simplifies your system design or test setup with benefits including:

- Input signal equalization for compensating gain variations no longer required
- Treat the amplifier as a calibrated gain block within your test equipment chain or system design
- Eliminate the need for external system measurements: couplers, power sensors, meter, and system software feedback loops
- Ideal for fast and accurate test setup and execution

ALC mode allows the user to command the amplifier output to a specified power level rather than adjusting the exciter to a certain power level to achieve the desired output. The output power is set either through the front panel or as a SCPI command via the LAN port. Wouldn't you rather command the amplifier to your desired output power rather than build your own feedback loop to control the exciter?

- Allows you to build your own system with uncalibrated components
- Eliminate the need to develop your own real-time feedback loop to monitor the output and set the input exciter level
- Simplifies and speeds up system integration
- Output Level is set accurately across the entire band

SKU	Start (MHz)	Stop (MHz)	Pout (Watt)	Gain (dB)	Size (Chassis)

2217	5200	5900	8000 Pulse 25%	70	R17U

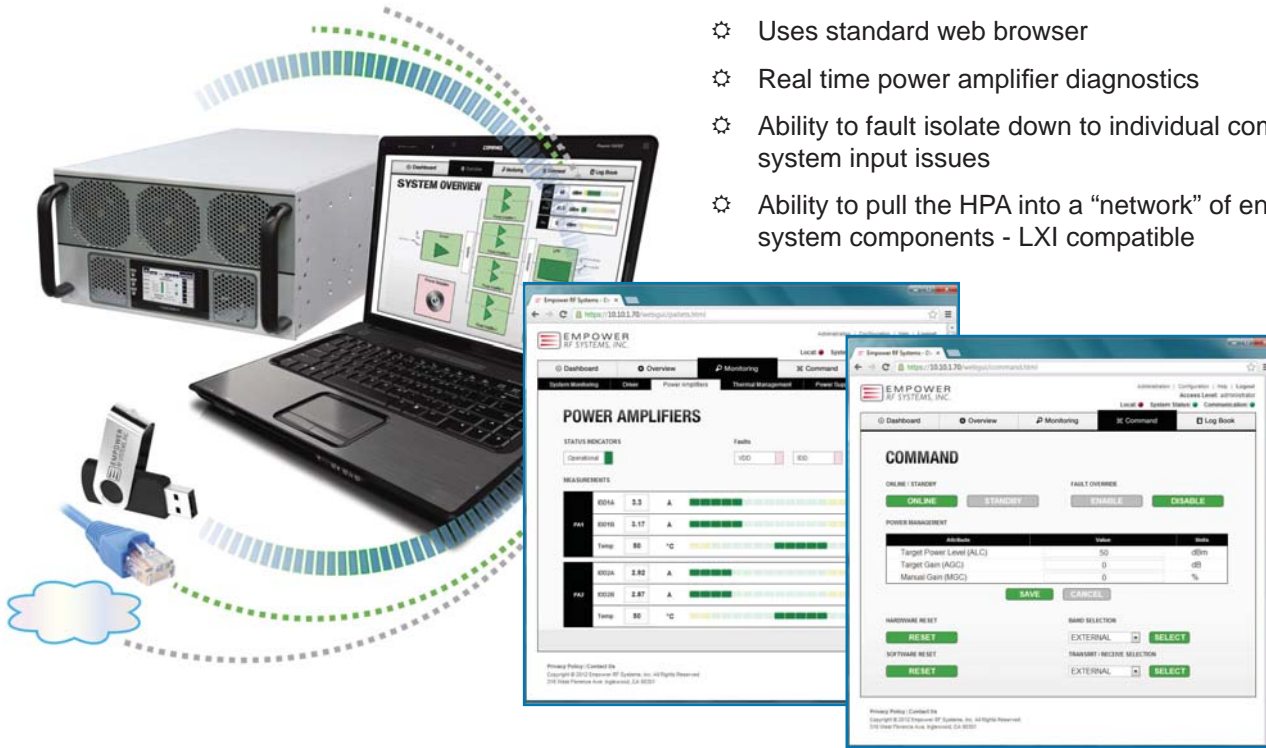

Manual Gain Control (MGC)

MGC is the output power mode found in your typical high power RF amplifier. The amp is run in an open loop mode where the output power vs frequency changes due to device non-linearity and variations of temperature. With this mode you can take advantage of the gain peaks to get the most output power available if you are working in the associated frequency range.

POWER AMPLIFIERS THAT ARE SMARTER

- ⚙ Uses standard web browser
- ⚙ Real time power amplifier diagnostics
- ⚙ Ability to fault isolate down to individual components or system input issues
- ⚙ Ability to pull the HPA into a “network” of end user system components - LXI compatible
