Control software for ESD generators

- For ESD Generators **SESD 30000, SESD 230 and SESD 216**
- For **Win98, 2000, XP, Win7, Win10**

Description

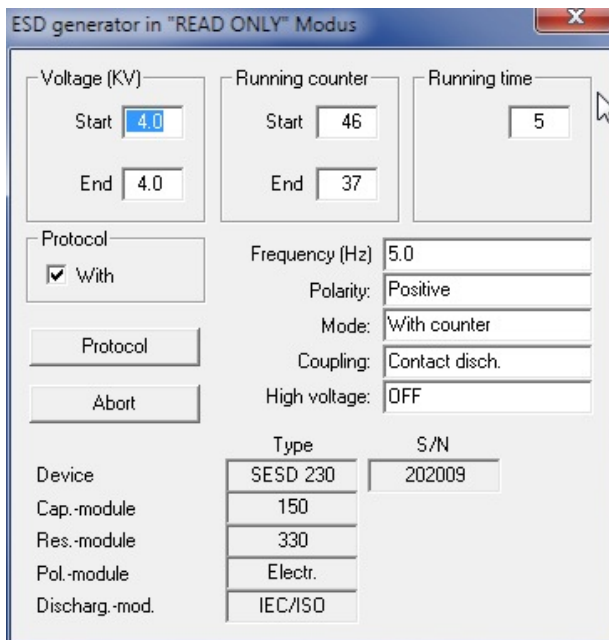

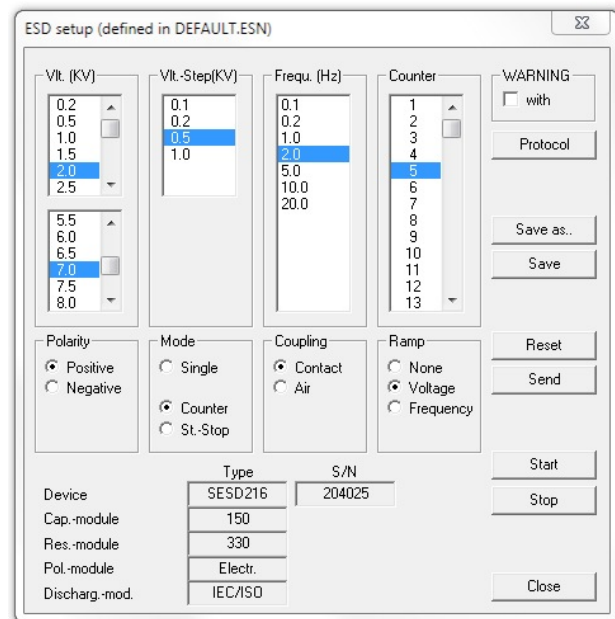

The ESD-SOFT program makes it possible to operate the ESD generators from the Schlöder company via a serial interface. The program, which runs under Microsoft® Windows ©, controls the ESD generators via an RS 232 lightwave interface cable.

All parameters, which can also be operated directly at the ESD generator, can be set. In addition, there is the option of defining ramp functions as well as device-specific test sequences. With the aid of the sequence control, several individual programs can be strung together and thus complex test sequences can be created.

Furthermore, the software allows you to log your manually performed ESD checks with its "ESD READ ONLY" function.

In this window all parameters are set, which are transmitted to the ESD generator. The individual parameters are designed as list boxes so that the permitted values can be conveniently accessed.

An automatic plausibility check is performed so that only values that are within the limit parameters are transmitted.

In "READ ONLY" mode, the software registers all operations performed on the ESD generator. This feature provides a transcript of the manual test procedures performed during the ESD test.
